

Notes 7 : CLT and Poisson Convergence

Math 733 - Fall 2013

Lecturer: Sebastien Roch

References: [Dur10, Section 3.4, 3.6].

1 Deterministic Lemmas

We will need some deterministic lemmas throughout.

LEM 7.1 Let z_1, \dots, z_n and w_1, \dots, w_n be complex numbers of modulus $\leq \theta$. Then

$$\left| \prod_{m=1}^n z_m - \prod_{m=1}^n w_m \right| \leq \theta^{n-1} \sum_{m=1}^n |z_m - w_m|.$$

Proof:

$$\begin{aligned} \left| \prod_{m=1}^n z_m - \prod_{m=1}^n w_m \right| &\leq \left| z_1 \prod_{m=2}^n z_m - z_1 \prod_{m=2}^n w_m \right| + \left| z_1 \prod_{m=2}^n w_m - w_1 \prod_{m=2}^n w_m \right| \\ &\leq \theta \left| \prod_{m=2}^n z_m - \prod_{m=2}^n w_m \right| + \theta^{n-1} |z_1 - w_1|, \end{aligned}$$

and use induction. ■

LEM 7.2 If $\max_{1 \leq j \leq n} |c_{j,n}| \rightarrow 0$, $\sum_{j=1}^n c_{j,n} \rightarrow \lambda$ and $\sup_n \sum_{j=1}^n |c_{j,n}| < \infty$ then

$$\prod_{j=1}^n (1 + c_{j,n}) \rightarrow e^\lambda.$$

Proof: Note that $\frac{\log(1+x)}{x} \rightarrow 1$ as $x \rightarrow 0$. Hence $\forall \varepsilon > 0$, $\exists \delta > 0$ such that $|x| < \delta$ implies

$$x - \varepsilon|x| < \log(1+x) < x + \varepsilon|x|.$$
■

The following deterministic statement is proved in [D].

LEM 7.3 We have

$$\left| e^{ix} - \sum_{m=0}^n \frac{(ix)^m}{m!} \right| \leq \min \left(\frac{|x|^{n+1}}{(n+1)!}, \frac{2|x|^n}{n!} \right).$$

LEM 7.4 If b is a complex number with $|b| \leq 1$ then

$$|e^b - (1+b)| \leq |b|^2.$$

Proof: By a Taylor expansion, if $|b| \leq 1$

$$\begin{aligned} |e^b - (1+b)| &\leq |b^2/2! + b^3/3! + \dots| \\ &\leq \frac{|b|^2}{2} (1 + 1/2 + 1/2^2 + \dots) \\ &= |b|^2. \end{aligned}$$

■

2 Easy laws

2.1 CLT

As we saw before, the behavior of ϕ around 0 contains information about the tail/moments of μ :

THM 7.5 We have

$$\left| \mathbb{E} [e^{itX}] - \sum_{m=0}^n \frac{\mathbb{E}[(itX)^m]}{m!} \right| \leq \mathbb{E} [\min\{|tX|^{n+1}, 2|tX|^n\}].$$

Proof: This follows from Lemma 7.3. ■

We can now prove the CLT.

THM 7.6 Let $(X_n)_n$ be IID with $\mathbb{E}[X_1] = \mu$ and $\text{Var}[X_1] = \sigma^2 < +\infty$. Then if $S_n = \sum_{k \leq n} X_k$

$$Z_n = \frac{S_n - n\mu}{\sigma\sqrt{n}} \Rightarrow Z,$$

where $Z \sim N(0, 1)$.

Proof: Suffices to prove the result for $\mu = 0$. Note that

$$\phi_{X_1}(t) = 1 - \frac{\sigma^2 t^2}{2} + o(t^2),$$

where the error term is $\leq t^2 \mathbb{E}[|t||X|^3 \wedge 2|X|^2]$. The expression inside the expectation is dominated by $2X^2$ which is integrable. So (DOM) implies that the expectation in the error term goes to 0 as $t \rightarrow 0$.

By independence

$$\phi_{Z_n}(t) = \left(1 - \frac{t^2}{2n} + o(t^2)\right)^n \rightarrow e^{-t^2/2}.$$

The inversion formula and continuity theorem conclude the proof. (In fact, one must prove the above limit for complex numbers. This follows from Lemmas 7.1 and 7.4.) ■

2.2 Poisson convergence

THM 7.7 Let X_n be binomial with parameters n and λ/n , for $\lambda > 0$. Then $X_n \Rightarrow Z$ where Z is Poisson with parameter λ .

Proof: The CF of X_n is

$$\phi_{X_n}(t) = \left(\frac{\lambda}{n} e^{it} + \left(1 - \frac{\lambda}{n}\right)\right)^n \rightarrow \exp(\lambda(e^{it} - 1)),$$

for all t as $n \rightarrow +\infty$, by Lemmas 7.1 and 7.4. ■

3 Lindeberg-Feller CLT

THM 7.8 (Lindeberg-Feller CLT) For each n , let $X_{n,m}$, $1 \leq m \leq n$, be independent with $\mathbb{E}[X_{n,m}] = 0$. Suppose

1. $\sum_{m=1}^n \mathbb{E}[X_{n,m}^2] \rightarrow 1$.
2. $\forall \varepsilon > 0, \lim_n \sum_{m=1}^n \mathbb{E}[|X_{n,m}|^2; |X_{n,m}| > \varepsilon] = 0$.

Then

$$Z_n = \sum_{m=1}^n X_{n,m} \Rightarrow Z,$$

as $n \rightarrow \infty$ where $Z \sim N(0, 1)$.

In other words, a sum of a large number of small independent effects is approximately normal.

EX 7.9 To recover our previous CLT, take $X_{n,m} = X_m/\sqrt{n}$. The first condition is clearly satisfied. If $\varepsilon > 0$

$$\begin{aligned} \sum_{m=1}^n \mathbb{E}[|X_{n,m}|^2; |X_{n,m}| > \varepsilon] &= n\mathbb{E}[|X_1/\sqrt{n}|^2; |X_1/\sqrt{n}| > \varepsilon] \\ &= \mathbb{E}[|X_1|^2; |X_1| > \varepsilon\sqrt{n}] \rightarrow 0, \end{aligned}$$

by (DOM) and $\mathbb{E}[X_1^2] < +\infty$.

Proof: Letting $\phi_{n,m}$ be the CF of $X_{n,m}$ and $\sigma_{n,m}^2 = \mathbb{E}[X_{n,m}^2]$. It suffices to prove

$$\prod_{m=1}^n \phi_{n,m}(t) \rightarrow e^{-t^2/2}.$$

We will show this by proving two claims.

CLAIM 7.10

$$\left| \prod_{m=1}^n (1 - t^2 \sigma_{n,m}^2/2) - e^{-t^2/2} \right| \rightarrow 0.$$

CLAIM 7.11

$$\left| \prod_{m=1}^n \phi_{n,m}(t) - \prod_{m=1}^n (1 - t^2 \sigma_{n,m}^2/2) \right| \rightarrow 0.$$

1. **Claim 7.10.** Note that

$$\sigma_{n,m}^2 \leq \varepsilon^2 + \mathbb{E}[|X_{n,m}|^2; |X_{n,m}| > \varepsilon],$$

so by the second condition we have $\max_{1 \leq m \leq n} \sigma_{n,m}^2 \rightarrow 0$ (where the maximum over the second term is bounded by its sum). By the first condition,

$$\sum_{m=1}^n -t^2 \sigma_{n,m}^2/2 \rightarrow -\sigma^2 t^2/2.$$

The result follows from Lemma 7.2 (or Lemmas 7.1 and 7.4).

2. Claim 7.11.

By Lemma 7.3 above (this calculation explains why we need the more sophisticated error term; o.w. the ε would not come out),

$$\begin{aligned} |\phi_{n,m}(t) - (1 - t^2\sigma_{n,m}^2/2)| &\leq \mathbb{E}[|tX_{n,m}|^3 \wedge 2|tX_{n,m}|^2] \\ &\leq \mathbb{E}[|tX_{n,m}|^3; |X_{n,m}| \leq \varepsilon] + \mathbb{E}[2|tX_{n,m}|^2; |X_{n,m}| > \varepsilon] \\ &\leq \varepsilon t^3 \mathbb{E}[|X_{n,m}|^2; |X_{n,m}| \leq \varepsilon] + 2t^2 \mathbb{E}[|X_{n,m}|^2; |X_{n,m}| > \varepsilon]. \end{aligned}$$

Note that both terms on the LHS are bounded by 1 in absolute value (for n large enough by the max bound above). (Note this is not uniform in t , but for any fixed t one can choose n large enough so that the norm is less than 1.)

So the sum over m converges to 0 and the claim follows from Lemma 7.1. ■

3.1 Examples

A good example of a triangular array is the following, which we studied as an application of Chebyshev's inequality.

EX 7.12 (Random permutations) *Any permutation can be decomposed into cycles. E.g., if $\pi = [3, 9, 6, 8, 2, 1, 5, 4, 7]$, then $\pi = (136)(2975)(48)$. In fact, a uniform permutation can be generated by following a cycle until it closes and starting from the smallest unassigned element, and so on. Let $X_{n,k}$ be the indicator that the k -th element in this construction precedes the closure of a cycle. E.g., we have $X_{9,3} = X_{9,7} = X_{9,9} = 1$. The construction above implies that the $X_{n,k}$'s are independent and*

$$\mathbb{P}[X_{n,j} = 1] = \frac{1}{n - j + 1}.$$

That is because only one of the remaining elements closes the cycle. (To prove independence formally, show by induction on j that

$$\mathbb{P}[X_{n,i} = x_{n,i}, \forall i \leq j] = \prod_{i=1}^j \mathbb{P}[X_{n,i} = x_{n,i}].)$$

Letting S_n be the number of cycles in π we have

$$\mathbb{E}[S_n] = \sum_{j=1}^n \frac{1}{n - j + 1} \sim \log n,$$

and

$$\text{Var}[S_n] = \sum_{j=1}^n \text{Var}[X_{n,j}] = \sum_{j=1}^n \left(\frac{1}{n-j+1} - \frac{1}{(n-j+1)^2} \right) \sim \log n$$

Then we have

$$\frac{S_n}{\log n} \rightarrow_P 1 \quad \text{in fact} \quad \frac{S_n - \log n}{(\log n)^{1/2+\varepsilon}} \rightarrow_P 0,$$

by Chebyshev's inequality.

On the other hand, defining

$$Z_{n,j} = \frac{X_{n,j} - (n-j+1)^{-1}}{\sqrt{\log n}},$$

we get $\mathbb{E}[Z_{n,j}] = 0$, $\sum_{j=1}^n \mathbb{E}[Z_{n,j}^2] \rightarrow 1$, and for $\varepsilon > 0$

$$\sum_{j=1}^n \mathbb{E}[|Z_{n,j}|^2; |Z_{n,j}| > \varepsilon] \rightarrow 0,$$

since the sum is 0 as soon as $(\log n)^{-1/2} < \varepsilon$. (Note that $(n-j+1)^{-1} \leq 1$.)

Hence,

$$\frac{S_n - \log n}{\sqrt{\log n}} \Rightarrow Z,$$

where $Z \sim N(0, 1)$.

4 Law of rare events

4.1 First proof

THM 7.13 (Law of rare events) For each n , let $X_{n,m}$, $1 \leq m \leq n$, be independent with $\mathbb{P}[X_{n,m} = 1] = p_{n,m}$ and $\mathbb{P}[X_{n,m} = 0] = 1 - p_{n,m}$ and $\mathbb{P}[X_{n,m} \geq 2] = \varepsilon_{n,m}$. Suppose

1. $\sum_{m=1}^n p_{n,m} \rightarrow \lambda > 0$.
2. $\max_{1 \leq m \leq n} p_{n,m} \rightarrow 0$.
3. $\sum_{m=1}^n \varepsilon_{n,m} \rightarrow 0$.

Then

$$S_n = \sum_{m=1}^n X_{n,m} \Rightarrow Z,$$

as $n \rightarrow \infty$ where $Z \sim \text{Poi}(\lambda)$.

Proof: Under the last assumption, the probability that any of the $X_{n,m}$'s is ≥ 2 goes to 0 as $n \rightarrow +\infty$. Hence, by the converging together lemma (proved in homework), it suffices to consider the case $\varepsilon_{n,m} = 0$.

1. We first compute the moment-generating function of the Poisson distribution. Note that

$$\phi_Z(t) = \mathbb{E}[e^{itZ}] = \sum_{k \geq 0} \frac{e^{-\lambda} \lambda^k}{k!} e^{itk} = e^{-\lambda} e^{e^{it}\lambda} = \exp(\lambda(e^{it} - 1)).$$

2. We compute the moment-generating function of a Bernoulli. Note that

$$\phi_{X_{n,m}}(t) = \mathbb{E}[e^{itX_{n,m}}] = (1 - p_{n,m}) + p_{n,m}e^{it} = 1 + p_{n,m}(e^{it} - 1).$$

3. Since $\sum_{m=1}^n p_{n,m} \rightarrow \lambda$, it suffices to prove

$$\left| \exp\left(\sum_{m=1}^n p_{n,m}(e^{it} - 1)\right) - \prod_{m=1}^n [1 + p_{n,m}(e^{it} - 1)] \right| \rightarrow 0.$$

Note that

$$|\exp(p(e^{it} - 1))| = \exp(\operatorname{Re}(e^{it} - 1)) = \exp(\cos t - 1) \leq 1$$

and

$$|1 + p(e^{it} - 1)| = |(1 - p) + pe^{it}| \leq 1,$$

for $p \in [0, 1]$. So from Lemmas 7.1 and 7.4 above, using that $\max_{1 \leq m \leq n} p_{n,m} \leq 1/2$ and $|e^{it} - 1| \leq 2$,

$$\begin{aligned} & \left| \exp\left(\sum_{m=1}^n p_{n,m}(e^{it} - 1)\right) - \prod_{m=1}^n [1 + p_{n,m}(e^{it} - 1)] \right| \\ & \leq \sum_{m=1}^n |\exp(p_{n,m}(e^{it} - 1)) - [1 + p_{n,m}(e^{it} - 1)]| \\ & \leq \sum_{m=1}^n p_{n,m}^2 |e^{it} - 1|^2 \\ & \leq 4 \left(\max_{1 \leq m \leq n} p_{n,m} \right) \sum_{m=1}^n p_{n,m} \\ & \rightarrow 0. \end{aligned}$$

■

EX 7.14 A typical application of the law of rare events is to approximate a binomial. Assume you have 365 students in class. The probability that none of them has their birthday today is roughly e^{-1} .

4.2 Rate of convergence

Recall the following.

THM 7.15 *The following are equivalent:*

1. $F_{X_n}(x) \rightarrow F_X(x)$ for all points of continuity of F_X .
2. $\mathbb{E}[f(X_n)] \rightarrow \mathbb{E}[f(X)]$ for all $f \in C_b(\mathbb{R})$.
3. $\mathbb{E}[e^{itX_n}] \rightarrow \mathbb{E}[e^{itX}]$ for all $t \in \mathbb{R}$.

There are several ways of measuring how fast weak convergence occurs. For two PMs μ, ν , the following definition gives a natural notion of distance

$$\|\mu - \nu\|_{\mathcal{D}} = \sup_{f \in \mathcal{D}} \left| \int f(x)\mu(dx) - \int f(x)\nu(dx) \right|,$$

where \mathcal{D} is a class of functions. The choice $\mathcal{D} = \{f : f = \mathbb{1}_{(-\infty, x]}, x \in \mathbb{R}\}$ leads to the *Kolmogorov-Smirnov distance*.

For the record, the following is a standard result refining the CLT. The proof is in [D].

THM 7.16 (Berry-Esseen theorem) *Let $(X_n)_n$ be IID with $\mathbb{E}[X_1] = 0$, $\mathbb{E}[X_1^2] = \sigma^2$, and $\mathbb{E}|X_1|^3 = \rho < \infty$. If F_n is the DF of $(X_1 + \dots + X_n)/\sigma\sqrt{n}$ and F is the DF of the standard normal, then*

$$\sup_x |F_n(x) - F(x)| \leq \frac{3\rho}{\sigma^3\sqrt{n}}.$$

For the Poisson convergence theorem, we will use a stronger notion of distance.

DEF 7.17 (Total variation distance) *Let μ, ν be probability measure on (Ω, \mathcal{F}) . The total variation distance between μ and ν is defined as*

$$\|\mu - \nu\|_{\text{TV}} = \sup_{A \in \mathcal{F}} |\mu(A) - \nu(A)|.$$

Note this corresponds to taking $\mathcal{D} = \{f : f = \mathbb{1}_A, A \in \mathcal{F}\}$.

In the countable case, we give an equivalent definition.

LEM 7.18 *Assume $\Omega = S$ is countable and $\mathcal{F} = 2^S$. Then*

$$\|\mu - \nu\|_{\text{TV}} = \frac{1}{2} \sum_{\omega \in \Omega} |\mu(\omega) - \nu(\omega)|.$$

Proof: By the triangle inequality, for any $A \subseteq \Omega$

$$\sum_{\omega \in \Omega} |\mu(\omega) - \nu(\omega)| \geq |\mu(A) - \nu(A)| + |\mu(A^c) - \nu(A^c)| = 2|\mu(A) - \nu(A)|,$$

with equality when

$$A = \{\omega : \mu(\omega) \geq \nu(\omega)\}.$$

■

4.2.1 Poisson convergence by the coupling method

We prove the following refinement of the Poisson convergence theorem.

THM 7.19 For some n , let $X_{n,m}$, $1 \leq m \leq n$, be independent with $\mathbb{P}[X_{n,m} = 1] = p_{n,m}$ and $\mathbb{P}[X_{n,m} = 0] = 1 - p_{n,m}$. Then

$$\|\mu_{S_n} - \mu_Z\|_{\text{TV}} \leq \sum_{m=1}^n p_{n,m}^2,$$

where $S_n = \sum_{m=1}^n X_{n,m}$ and $Z \sim \text{Poi}(\lambda = \sum_{m \leq n} p_{n,m})$.

We will use coupling to prove the previous theorem. We restrict ourselves to a countable space $\Omega = S$ and $\mathcal{F} = 2^S$. We let $\Delta(S)$ be the set of all PMs on S .

DEF 7.20 (Coupling of RVs) A coupling of $\mu, \nu \in \Delta(S)$ is a pair of S -valued RVs $(X, Y) \in S^2$ (defined on a joint probability space) such that $X \sim \mu$ and $Y \sim \nu$.

EX 7.21 Let $S = \{0, 1\}$. Assume $\mu = \nu$. Then $X \sim \nu$, $Y \sim \nu$ independent defines a coupling. So does $X = Y$. If $\mu \neq \nu$, the latter is not possible. In order to maximize the probability that $\mathbb{P}[X = Y]$ one can choose $\mathbb{P}[X = Y = \omega] = \mu(\omega) \wedge \nu(\omega)$, $\mathbb{P}[X = 1, Y = 0] = (\nu(0) - \mu(0))_+$ and $\mathbb{P}[X = 0, Y = 1] = (\mu(0) - \nu(0))_+$.

The following lemma gets us closer to our goal.

LEM 7.22 (Coupling lemma) Let (X, Y) be any coupling of $\mu, \nu \in \Delta(S)$. Then

$$\|\mu - \nu\|_{\text{TV}} \leq \mathbb{P}[X \neq Y].$$

Proof: Note

$$\begin{aligned}\mu(s) &= \mathbb{P}[X = s] \\ &= \mathbb{P}[X = s, X \neq Y] + \mathbb{P}[X = s, Y = s] \\ &\leq \mathbb{P}[X = s, X \neq Y] + \mathbb{P}[Y = s] \\ &\leq \mathbb{P}[X = s, X \neq Y] + \nu(s).\end{aligned}$$

Similarly

$$(\nu(s) - \mu(s))_+ \leq \mathbb{P}[Y = s, X \neq Y],$$

so

$$|\mu(s) - \nu(s)| \leq \mathbb{P}[X = s, X \neq Y] + \mathbb{P}[Y = s, X \neq Y].$$

Summing over y gives the result.

(We also give an optimal coupling. Note that

$$1 = \sum_{\omega \in \Omega} [\mu(\omega) \wedge \nu(\omega) + (\mu(\omega) - \nu(\omega))_+] = \sum_{\omega \in \Omega} [\mu(\omega) \wedge \nu(\omega) + (\nu(\omega) - \mu(\omega))_+],$$

so that

$$\sum_{\omega \in \Omega} \mu(\omega) \wedge \nu(\omega) = 1 - \|\mu - \nu\|_{\text{TV}}.$$

Consider the following sub-intervals of $(0, 1)$. Divide up $(0, 1 - \|\mu - \nu\|_{\text{TV}})$ into disjoint intervals I_ω of length $\mu(\omega) \wedge \nu(\omega)$. Similarly, divide up $(1 - \|\mu - \nu\|_{\text{TV}}, 1)$ into disjoint intervals J_ω (respectively K_ω) of length $\mu(\omega)$ (respectively $\nu(\omega)$). Then a coupling achieving $\|\mu - \nu\|_{\text{TV}} = \mathbb{P}[X \neq Y]$ is obtained by picking U uniformly at random from $(0, 1)$ and assigning $X = Y = \omega$ if $U \in I_\omega$, or $X = \omega_1, Y = \omega_2$ if $U \in J_{\omega_1} \cap K_{\omega_2}$. ■

We come back to the proof of the theorem.

Proof: By the coupling lemma, it suffices to find a coupling with high agreement probability. For each $1 \leq m \leq n$, we define

$$\mathbb{P}[X_{n,m} = x, Y_{n,m} = y] = \begin{cases} 1 - p_{n,m} & \text{if } x = y = 0, \\ e^{-p_{n,m}} - 1 + p_{n,m} & \text{if } x = 1, y = 0, \\ e^{-p_{n,m}} \frac{p_{n,m}^y}{y!} & \text{if } x = 1, y \geq 1. \end{cases}$$

The marginal of $X_{n,m}$ is Bernoulli with parameter $p_{n,m}$ and the marginal of $Y_{n,m}$ is Poisson with parameter $p_{n,m}$. (The goal is to make them as close as possible in distribution.) Therefore

$$Z =_d T_n = \sum_{1 \leq m \leq n} Y_{n,m} \sim \text{Poi}(\lambda).$$

We compute the disagreement probability. Note

$$\begin{aligned}
 \mathbb{P}[S_n \neq T_n] &\leq \sum_{m \leq n} \mathbb{P}[X_{n,m} \neq Y_{n,m}] \\
 &= \sum_{m \leq n} [e^{-p_{n,m}} - 1 + p_{n,m} + \mathbb{P}[Y_{n,m} \geq 2]] \\
 &= \sum_{m \leq n} [e^{-p_{n,m}} + p_{n,m} - \mathbb{P}[Y_{n,m} \leq 1]] \\
 &= \sum_{m \leq n} [e^{-p_{n,m}} + p_{n,m} - e^{-p_{n,m}} - p_{n,m}e^{-p_{n,m}}] \\
 &= \sum_{m \leq n} p_{n,m}[1 - e^{-p_{n,m}}] \\
 &\leq \sum_{m \leq n} p_{n,m}^2.
 \end{aligned}$$

■

EX 7.23 (Poisson approximation to the binomial) Assume $p_{n,m} = \lambda/n$ for all m . Then

$$\|\text{Bin}(n, \lambda/n) - \text{Poi}(\lambda)\|_{\text{TV}} \leq \frac{\lambda^2}{n}.$$

4.3 Example with dependence

EX 7.24 (Matching) Let $S_n = \sum_{m=1}^n X_{n,m}$ be the number of fixed points in a uniform random permutation, where $X_{n,m} = 1$ if m is a fixed point. We want to compute $\mathbb{P}[S_n = k]$. Note that we cannot apply the previous theorem because of the lack of independence. However, a Poisson limit with $\lambda = 1$ seems natural. We will need the following lemma.

LEM 7.25 (Inclusion-exclusion formula) Let A_1, A_2, \dots, A_n be events and $A = \cup_{i=1}^n A_i$. Then

$$\begin{aligned}
 \mathbb{P}[A] &= \sum_{i=1}^n \mathbb{P}[A_i] - \sum_{i < j} \mathbb{P}[A_i \cap A_j] \\
 &\quad + \sum_{i < j < k} \mathbb{P}[A_i \cap A_j \cap A_k] - \dots + (-1)^{n-1} \mathbb{P}[\cap_{i=1}^n A_i].
 \end{aligned}$$

(Moreover, truncating the sum at any term gives an upper bound if the next term is negative and a lower bound if the next term is positive.)

Proof: Expand $\mathbb{1}_A = 1 - \prod_{i=1}^n (1 - \mathbb{1}_{A_i})$ and take expectation. See [D]. ■

Let $A_m = \{X_{n,m} = 1\}$. Then

$$\mathbb{P}[A] = n \frac{(n-1)!}{n!} - \binom{n}{2} \frac{(n-2)!}{n!} + \binom{n}{3} \frac{(n-3)!}{n!} - \dots$$

So

$$P[S_n > 0] = \sum_{m=1}^n \frac{(-1)^{m-1}}{m!},$$

and

$$P[S_n = 0] = \sum_{m=0}^n \frac{(-1)^m}{m!}.$$

Note that the first two terms cancel each other out. Hence

$$\begin{aligned} |\mathbb{P}[S_n = 0] - e^{-1}| &= \left| \sum_{m=n+1}^{+\infty} \frac{(-1)^m}{m!} \right| \\ &\leq \frac{1}{(n+1)!} \left| \sum_{k=0}^{\infty} \frac{1}{(n+2)^k} \right| \\ &= \frac{1}{(n+1)!} \left(1 - \frac{1}{n+2} \right)^{-1}. \end{aligned}$$

Finally,

$$\begin{aligned} \mathbb{P}[S_n = k] &= \binom{n}{k} \frac{1}{n(n-1)\cdots(n-k+1)} \mathbb{P}[S_{n-k} = 0] \\ &= \frac{1}{k!} \mathbb{P}[S_{n-k} = 0] \\ &\rightarrow \frac{e^{-1}}{k!}. \end{aligned}$$
