Putnam Problem Session

September 18, 2013

1. Let $d$ be a positive integer and let $A$ be a $d \times d$ matrix with integer entries. Suppose $I + A + A^2 + \ldots + A^{100} = 0$ (where $I$ denotes the identity $d \times d$ matrix, so $I$ has 1’s on the main diagonal). Determine the positive integers $n \leq 100$ for which $A^n + A^{n+1} + \ldots + A^{100}$ has determinant $\pm 1$.

2. Solve in real numbers the equation $3x - x^3 = \sqrt{x + 2}$.

3. Find
$$\sum_{k=1}^{\infty} \frac{k^2 - 2}{(k + 2)!}.$$

4. Let $\sum_{n=1}^{\infty} a_n$ be a convergent series of positive terms and let $b_n = \frac{1}{n a_n}$ for $n \geq 1$. Prove that
$$\sum_{n=1}^{\infty} \frac{n}{b_1 + b_2 + \ldots + b_n}$$
is convergent.

5. Let $\mathbb{C}$ denote the complex numbers and let $M_3(\mathbb{C})$ denote the $3 \times 3$ matrices with entries in $\mathbb{C}$. Suppose $A, B \in M_3(\mathbb{C}), B \neq 0,$ and $AB = 0$. Prove that there exists $0 \neq D \in M_3(\mathbb{C})$ such that $AD = DA = 0$.

6. Let $n$ be a nonzero integer. Prove that $n^4 - 7n^2 + 1$ can never be a perfect square.

7. How many sequences of 1’s and 3’s sum to 16? (Examples of such sequences are $\{1, 3, 3, 3, 3, 3\}$ and $\{1, 3, 1, 3, 1, 3, 1, 3\}$.)

8. Determine all invertible $2 \times 2$ matrices $A$ with complex numbers as entries satisfying $A = A^{-1} = A^T$, where $A^T$ denotes the transpose of $A$.
